Air Bags – stabilize and protect your cargo from damage during transport

food and beverage logistics is able to offer load restraint by Air Bags for your FCL-shipment to protect your shipment from transit damage.

Air Bags are used to minimize the risk for cargo loads to slip out of position during the transport. Therefore you put Air Bags between the hollows of the units. With a special pump or a compressor you can inflate the bags easily. Next to the bags you can order the special pump as well.

Why to use Air Bags?

- ✓ Air Bags are quickly installed.
- ✓ Air Bags are economical to use.
- ✓ The Air Bags determine the best possible solution for your application, whether it's for use for vertical or horizontal application.
- ✓ The Air Bags are environmentally friendly as they are manufactured with identified materials and are 100% recyclable.
